英文簡介

Since my childhood, my parents ran a diner shop and had me help the chores. Their hard-working personality has done a great impact on me, not only made me more endurable for repetitious missions but let me learn to cooperate with partners and enhance my capability of concentration.

I graduated from industrial design department at college; for the most part of the job I did needs techniques such as how to use graphic and 3D application software. The curriculum based on cultivating students' ability of solving problems, finding resources they need and self-learning instead of a specific technique, so I chose to enter the field I'd been familiar with -- the catering industry and worked in oppressive and hectic environment for more than three years. Under the influence of the pandemic this year, the prospects of the industry meet a slump. I think it's time to adjust my long-term career plan, and I thought back to the interdisciplinary projects I did. Those experiences pushed me into starting learning programming from other students who study relative main courses or self-learning using program to manipulate animation and some human-machine devices.

Therefore, I chose to change profession, and have been studying programming courses for career specifically, and I really tried as hard as I could to improve my programming skills. The programming language I specialize in is Python. Largely, I also own the skills like using Python to crawl the open-data on the internet, producing simple user interfaces, plotting non-static chart made with auxiliaries like css style and html structure. Besides, I'm capable to program SQL language to manipulate database.

The more I learn about programming, the better I' m interested in it. In addition to that, I expect myself to be more competent to accept more challenges. Thus my current situation is studying visual computation, Java and applying for a post at the same time. If my ability corresponds to your company's value, I'll be glad for the cooperation.
